

# Coupled cluster theory for solids and surfaces

**Andreas Grüneis**

*Institute for Theoretical Physics, Vienna University of Technology,  
Wiedner Hauptstrasse 8-10, 1040 Vienna, Austria*

This presentation will review recent progress in applying periodic coupled cluster theory to solids and surfaces. We will discuss techniques that reduce the computational cost by accelerating the convergence of calculated properties towards the complete basis set as well as the thermodynamic limit using a plane wave basis [1-3]. Recent developments have enabled an increasing number of *ab initio* studies and allowed for assessing the accuracy of coupled cluster theories by comparing to experimental findings as well as quantum Monte Carlo results. The presented applications will include phase transitions of solids [4] and molecular adsorption energies [5-7].
