

## First series transition metals: atomic multiplets

Varun Rishi and Rodney Bartlett

Quantum Theory Project, University Of Florida.

In this study of some of the first series transition metal atoms, we have used various methods from the quantum chemist's toolbox to figure out what it takes to get the relative ordering of the atomic multiplet states right and the corresponding splitting energies closest to the experimental values. In the process, we also carry out relativistic ab initio quantum chemical calculations and look at the relative performance of the available methods.
